Non-invasive method for diagnosis of hypertrophic cardio-myopathy useful for testing asymptomatic individual(s).

Example 1; Col 10; 22pp; English.

AAQ91121-Q91130 are nested PCR primers used for the amplification and identification of beta-cardiac myosin heavy-chain RNA. They are used in a new non-invasive method for diagnosing hypertrophic cardiomyopathy (HC), the method involves detecting the presence or absence of specific HC-sasociated mutations in the beta-cardiac myosin heavy-chain obtained from a blood sample. The method may be used to diagnose familial or sporadic HC and the non-invasive method is particularly important when testing

oligonucleotides capable of amplifying beta-cardiac myosin heavy-chain

ö
asymptomatic individuals suspected of having the disease. The method has a broad applicability and may be used to detect mutations responsible for other genetically inheritable diseases e.g. cystic fibrosis, Gaucher's disease, haemophilia A and B. Duchenne's muscular dystrophy, sickle cell anaemia, Tay-Sachs disease and phenylketonuria
                                                                                                                                                                                                                                                                                                                                                    Human; ss; PCR; primer; beta cardiac myosin heavy chain; FHC;

DNA. The method is useful for detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy. This method is especially useful for diagnosing SHC and FHC, as well as for determining the estimated the life expectancy of a person with familial hypertrophic cardiomyopathy. In particular, the method is useful for determining an individual's genetic information, and diagnosing e.g. Gaucher's disease, haemophilia, buchenne's muscular dystrophy, sickle cell ansemia, Tay-Sachs disease, phenylketonuria or cystic fibrosis. The present sequence is a PCR primer used to amplify a region of the beta cardiac myosin heavy chain cDNA containing an FHC-associated mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy (familial or sporadic, FHC, SHC) for facilitating the diagnosis of hypertrophic cardiomyopathy, comprising amplifying beta-cardiac myosin heavy-chain DNA forming an amplified product, and detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy in the amplified product, thus, facilitating the diagnosis of hypertrophic cardiomyopathy. Also included are a set of DNA oligonucleotide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting mutations associated with hypertrophic cardiomyopathy to diagnose hypertrophic cardiomyopathy, comprises amplifying beta-cardiac myosin heavy-chain DNA and detecting the mutation in the amplified
                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to detecting the presence or absence of a mutation and secoidated with hypertrophic cardiomyopathy (sporadic or familial, SHC and FHC) comprises detecting a mutation associated with hypertrophic cardiomyopathy in an amplified product of a beta cardiac myosin heavy chain DNA. The mutations associated with SHC/FHC are detected in the myosin gene isolated from blood, by detecting mis-matched areas in RNA-DNA hybrid double strands (RNA from the normal gene, DNA from the suspect determine life expectancy in affected individuals e.g. using a Kaplan-Meier curve for the classified type of FHC causing point mutation. Also included are an RNA probe comprising ribonucleotides arranged in a sequence which is complementary to at least a portion of beta-cardiac myosin heavy-chain DNA and a set of DNA oligonucleotide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two

Example 1; Page 5; 22pp; English.

oligonucleotide primers being useful for facilitating the diagnosis of hypertrophic cardiomyopathy by being capable of detecting a hypertrophic cardiomyopathy (comprising the diagnosis of hypertrophic cardiomyopathy (comprising a first container holding an RNA probe completely hybridisable to the beta-cardiac myosin heavy chain DNA, where the RNA probe is capable of detecting a hypertrophic cardiomyopathy associated mutation, a second container holding primers for amplifying beta-cardiac myosin heavy-chain DNA and instructions for using the components of the kit to detect the presence or absence of a hypertrophic cardiomyopathy-associated mutation in amplified beta-cardiac myosin heavy-chain DNA). The method is used for amplified beta-cardiac myosin heavy-chain DNA). The method is used for detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy. Presently, the diagnosis of individuals hypertrophic cardiomyopathy relies on the presence of typical clinical symptoms and the demonstration of unexplained ventricular hypertrophy. The present invention is non-invasive and based, at least in bart, on the discovery that hypertrophic cardiomyopathy is caused by point mutations in the beta cardiac myosin heavy-chain gene. Prior art reveals that there are no extensive studies involving a large number of families which established that this particular disease or disorder was caused by point mutations in the beta cardiac myosin heavy-chain gene. The present sequence is a PCR primer used to amplify a region of the beta cardiac myosin heavy chain having a disease-related point mutation. which amplify beta-cardiac myosin heavy-chain DNA (the set of 88888888888888888888888888888888888

The present invention describes nument interferent, it is tereptor, its present invention describes nument interferent, its tereptor, its protein (ILITRLP), isolated from a CDNA library of human adult pulmonary tissue. The present sequence represents a PCR primer for human ILITRLP. ILITRLP and its agonists can be used to treat disorders relating to cellular activation, haemostasis, angiogenesis, tumour metastasis, cellular activation and ovulation, and neurogenesis. They can also be used to enhance host defences against resistant chronic and acute infections, cellular migration and ovulation of the attraction and acute infections, cellular microbial leukocytes. ILITRLP may also be used to increase T-cell mcdiated autoimmune diseases and lymphocytic leukaemias, to cregulate haematopoiesis by regulating the activation and differentiation of T-cell mcdiated autoimmune diseases and lymphocytic leukaemias, to combilisation or to treat sepsis repedicts cells, e.g. to release mature cleukocytes from the bone marrow following chemotherapy, i.e. in stem cell eukocytes from the bone marrow following chemotherapy, i.e. in stem cell disgnosis or treatment of immune system related disorders e.g. tumours, cancers, interstitial lung disease, and any disregulation of immunity, humoral immunity, inflammatory bowel
New human interleukin-17 receptor like protein, e.g. to treat disorders relating to cellular activation.

```
The patent relates to novel interleukin-17-like receptor protein (IL-17RLP) IL-17RLP is a homologue of the IL-17 receptor and has a wide range of cytokine receptor-like activities. IL-17RLP or its agonists may be used to enhance host defenses against resistant chronic and acute infections, e.g. mycobacterial infections, via the attraction and cetivation of microbicidal leukcytes. It may also be used to increase T-cell proliferation by stimulating IL-2 hosynthesis, for the treatment of T-cell mediated autoimmune diseases and lymphocytic leukaemias. IL-17RLP may also be used to regulate hematopoiesis and to treat sepsis.

Traple agonists and antagonists can also be used to modulate IL-6. TYRLP agonists and intreatment of cancers such as myelomas, carracellular intreatment of cancers such as myelomas, but seful in treatment of cancers such as myelomas.

Sequession, useful in treatment of cancers such as myelomas, so the side of the 3 PCR primer used for the amplification of IL-17RLP leader is the 3 PCR primer used in the cloning and expression of IL-17RLP protein
Novel polynucleotides encoding interleukin-17-like receptor protein, useful for diagnosis and treatment of immune system-related disorders, e.g. sepsis and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 26 BP; 2 A; 13 C; 7 G; 4 T; 0 U; 0 Other;

immune-related disorders e.g., Crohn's disease, tumor, inflammatory bowel disease, autoimmune diseases, lymphocytic leukemias, or graft versus host Novel isolated interleukin 17-receptor-like protein useful for treating WPI; 2004-662639/65. disease

Example 2; SEQ ID NO 9; 145pp; English.

The invention relates to an isolated interleukin 17-receptor-like protein (IL17RLP) (I) comprising an amino acid sequence that is 95% or more identical to a sequence e.g., sequence having amino acids from positions 19-407 of a fully defined sequence (SI) of 436 amino acids as given in the specification, sequence having amino acids from positions 18-407 of (SI) that comprises N-terminal methionine or sequence having amino acids from positions 1-407 of (SI). (I) is useful for treating amino acids related to cellular activation, hemostasis, angiogenesis, tumor metastasis, cellular migration, ovulation or neurogenesis. (I) is useful for treating immune-related disorders e.g., Crohn's disease, tumor inflammatory bowel disease, autoimmune diseases, lymphocytic leukemias, or graft versus host disease. (II) is useful for chromosomal cidentification. (I) exhibits enhanced activity, solubility and stability, and is produced in large quantities. This sequence corresponds to a PCR primer to amplify the extracellular region DNA from the human IL17RLP

New fusion protein comprising a stem region of fucosyltransferase VI and a catalytic domain of fucosyltransferase VII, useful for enzymatically synthesizing glycoproteins, glycolipids, and oligosaccharide moieties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Primer; amplify; PCR; expandase gene; cefE; Nicordia lactamdurans; Streptomyces clavuligarus; expression cassette; acyltransferaes; fungus; Penicillin chrysogenum; hybrid promoter; Aspergillus nidulans; 7-ADCA; 7-amino-desacetoxycephalosporanic acid; cephalosporin; antibiotic; se.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a fusion protein comprising a stem region of human fucosyltransferase VI and a catalytic domain of fucosyltransferase VII, where the fusion protein has high enzymatic activity, and catalyses the transfer of fucose residue from a donor substrate to an acceptor substrate. The fusion protein is useful for enzymatically synthesising glycoproteins, glycolipids, and oligosaccharide moieties. The present sequence is a PCR primer used to isolate a coding sequence in the exemplification of the invention
                                                                                                                          Alphal, 3 fucosyltransferase; FT; glycosyltransferase; fusion protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Expandase gene amplification primer #11 for expression cassette.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 17.2; DB 12; Length 37;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New fusion protein comprising a stem region of fucosyltransferase VI and a catalytic domain of fucosyltransferase VII, useful for enzymatically synthesizing glycoproteins, glycolipids, and oligosaccharide moieties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a fusion protein comprising a stem region of human fucosyltransferase VI and a catalytic domain of fucosyltransferase VII, where the fusion protein has high enzymatic activity, and catalyses the transfer of fucose residue from a donor substrate to an acceptor substrate. The fusion protein is useful for enzymatically synthesising glycoproteins, glycollyids, and enzymatically synthesising glycoproteins, glycollyids, and oligosaccharide moieties. The present sequence is a PCR primer used to isolate a coding sequence in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                           Primers (AAQ84983-95) were used to amplify the expandase gene (cefE) from either Nicordia lactamdurans or Streptomyces clavuligerus. The resultant sequences were placed in an expression cassette for simultaneous expression of the cefE gene and the gene encoding an acyltransferas expression cassette is placed in the fungus Penicillin chrysogenum. Expression of the genes in the cassette is driven either by a trp-lac hybrid promoter or the promoter from the Aspergillus nidulans gpdA gene. The terminator is the 3'-end of the p.chrysogenum penDE gene. The primers AAQ84991-3 were used to amplify a 0.5 kb region containing the
                                                                                                                       7-amino-desacetoxy-cephalosporanic acid prodn. in Penicillium chrysogenum
                                                                                                                                                                                                                                                                                                                desacetoxycephalosporanic acid (7-ADCA), an intermediate in the production of cephalosporin antibiotics. Note: the sequences shown in this patent are identical to those in patent WO 95/04149. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                P.chrysogenum penDE (acyltransferase gene) terminator sequence. This sequence was linked by PCR to the 3' end of the N.lactamdurans cefE gene. The cassette is used in the production of 7-amino-

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid
                                                                               7-amino-desacetoxy-cephalosporanic acid prodn. in Penicillium chrysogenum - transformed with expandase gene, using 3,3'-thiodi:propionic acid as side chain precursor and deacylation of intermediate.
                                                                                                                                                                                                                                                                                                                                        AAQ82707-082719 are oligonuclectides used in the construction of P. chrysogenum expression cassettes for the N. lactamdurans and S. clavuligerus ceff (expandase) gene. The transformed P. chrysogenum can now be used for 7-amino-desacetoxy-cephalosporanic acid prodn. an intermediate for cephalosporin antibiotics. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 41023; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms,

New human interleukin-17 receptor like protein, e.g. to treat disorders Example 3; Page 100; 133pp; English. relating to cellular activation.

The present invention describes human interleukin 17 receptor like protein (IL17RLP), isolated from a CDNA library of human adult pulmonary tissue. The present sequence represents a PCR primer for human IL1RLP. IL17RLP and its agonists can be used to treat disorders relating to cellular activation, haemostasis, angiogenesis, tumour metastasis, cellular migration and ovulation, and neurogenesis. They can also be used to enhance host defences against resistant chronic and acute infections, e.g. mycobacterial infections via the attraction and activation of microbial leukocytes. IL17RLP may also be used to increase T-cell

proliferation by the stimulation of IL-2 biosynthesis for the treatment

The present sequence represents a PCR primer for human ILI7RLP. ILI7RLP and its agonists can be used to treat disorders relating to cellular activation, haemostasis, angiogenesis, tumour metastasis, cellular migration and ovulation, and neurogenesis. They can also be used to enhance host defences against resistant chronic and acute infections, e.g. mycobacterial infections via the attraction and activation of microbial leukocytes. ILI7RLP may also be used to increase f-cell
proliferation by the stimulation of IL-2 biosynthesis for the treatment of T-cell mediated autoimmune diseases and lymphocytic leukaemias, to regulate haematopolesis by regulating the activation and differentiation of various haematopolesic progenitor cells, e.g. to release mature leukocytes from the bone marrow following chemotherapy, i.e. in stem cell mobilisation or to treat sepsis. The products can also be used for the diagnosis or treatment of immune system related disorders e.g. tumours, cancers, interstitial lung disease, and any disregulation of immune cell function including autoimmunity, arthritis, leukaemias, lymphomas, immunosuppression, immunity, humoral immunity, inflammatory bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human interleukin-17 receptor like protein, e.g. to treat disorders relating to cellular activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               detection; immune system related disorder; haemostasis; cellular activation; angiogenesis; tumour metastasis; ovulation; cellular migration; neurogenesis; infection; T-cell proliferation; autoimmune disease; lymphocytic leukaemia; haematopoiesis; regulation; sepsis; tumour; cancer; interstitial lung disease; arthritis; lymphoma; immunosuppression; immunity; inflammatory bowel disease; arthritis; lymphoma; myelo suppression; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The patent relates to novel interleukin-17-like receptor protein (IL-17RLP). IL-17RLP is a homologue of the IL-17 receptor and has a wide range of cytokine receptor-like activities. IL-17RLP or its agonists may be used to enhance host defenses against resistant chronic and acute infections, e.g. mycobacterial infections, via the attraction and cute activation of microbicidal leukocytes. It may also be used to increase T-cell proliferation by stimulating IL-2 biosynthesis, for the treatment of T-cell mediated autoimmune diseases and lymphocytic leukaemias. IL-17RLP
            of T-cell mediated autoimmune diseases and lymphocytic leukaemias, to regulate haematopoiesis by regulating the activation and differentiation of various haematopoietic progenitor cells, e.g. to release mature leukocytes from the bone marrow following chemotherapy, i.e. in stem mobilisation or to treat sepsis. The products can also be used for the diagnosis or treatment of immune system related disorders e.g. tumours, cancers, interstitial lung disease, and any disregulation of immune cell function including autoimmunity, arthritis, lenkaemias, lymphomas, immunosuppression, immunity, humoral immunity, inflammatory bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Interleukin-17-like receptor protein; IL-17RLP; cytokine receptor; resistent chronic infection; acute infection; wycobacterial infection; T-cell proliferation; IL-2 biosynthesis; lymphocytic leukaemia; T-cell mediated autoimmune disease; hematopoiesis; sepsis; hybridoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8
                                                                                                                                                                                                                                                                                              ö
may also be used to regulate hematopoiesis and to treat sepsis.

Extracellular IL-17RLP domains may be used as antagonists of IL-17RLP. IL-17RLP and antagonists can also be used to modulate IL-6 expression, useful in treatment of cancers such as myelomas, plasmacytomas and hybridomas and Lennert's Lymphoma. The present sequence is the 3' PCR primer used for the amplification of IL-17RLP cDNA. This primer comprises Aspil8 and 17 of nucleotides complementary to the 3'coding region immediately before the stop codon. This is used in the construction of vectors for expression in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primers AAA75768-69 were used to amplify a fragment of cDNA encoding a human interleukin 17-receptor-like protein (IL17RLP). The IL17RLP polypeptide is useful for screening for agonists and antagonists. These antagonists and agonists are useful for treating, diagnosing, detecting and or preventing disorders related to cellular activation, hemostasis, angiogenesis, tumour metastasis, cellular migration, ovulation or neurogenesis, such as osteoporosis, arthritis and autoimmune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel gene encoding a polypeptide of the interleukin-17 receptor family, and an antagonist and agonist of the polypeptide, useful for treating, diagnosing, detecting and/or preventing immune system related disorders.
                                                                                                                                                                                                                                                                                              Gaps

PCR primers AAA75770-71 were used to amplify a fragment of DNA encoding a human interleukin 17-receptor-like protein (IL17RLP). The IL17RLP polypeptide is useful for screening for agonists and antagonists. These antagonists and agonists are useful for treating, diagnosing, detecting and or preventing disorders related to cellular activation, haemostasis, ampiogenesis, thuour metragens, cellular migration, ovulation or neurogenesis, such as osteoporosis, arthritis and autoimmune disorders e.g. systemic lupus erythromatosus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel gene encoding a polypeptide of the interleukin-17 receptor family, and an antagonist and agonist of the polypeptide, useful for treating, diagnosing, detecting and/or preventing immune system related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human interleukin 17 receptor-like protein extracellular domain primer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated interleukin 17-receptor-like protein (ILITRLP) (I) comprising an amino acid sequence that is 95% or more identical to a sequence e.g., sequence that is 95% or more 19-407 of a fully defined sequence (S1) of 426 amino acids from positions 19-407 of a fully defined sequence (S1) of 426 amino acids as given in the specification, sequence having amino acids from positions 18-407 of (S1) that comprises N-remainal methionine or sequence having amino acids from positions 1-407 of (S1). (I) is useful for treating disorders metastasis, cellular activation, hemostasis, angiogenesis, tumor metastasis, cellular migration, ovulation or neurogenesis, tumor inflammatory bowel disease, autoimmune diseases, lymphocytic leukemias, or grafit versus host disease. (II) is useful for chromosomal identification. (I) exhibits enhanced activity, solubility and stability, and is produced in large quantities. This sequence corresponds to a PCR.
interleukin 17-receptor-like protein; IL17RLP; cellular activation; hemostasis; angiogenesis; tumor metastasis; cellular migration; ovulation; neurogenesis; immune-related disorder; Crohn's disease; tumor; inflammatory bowel disease; autcimmune disease; lymphocytic leukemia; graft versus host disease; chromosomal identification; primer; PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      se; antiinflammatory; cytostatic; gastrointestinal; immunosuppressive; interleukin 17-receptor-like protein; IL17RLP; cellular activation; hemostasis; angiogenesis; tumor metastasis; cellular migration; ovulation; neurogenesis; immune-related disorder; Crohn's disease; tumor; inflammatory bowel disease; autoimmune disease; lymphocytic leukemia; graft versus host disease; chromosomal identification; primer; PCR.

The invention relates to an isolated interleukin 17-receptor-like protein (ILIRIP) (I) comprising an amino acid sequence that is 95% or more identical to a sequence e.g., sequence having amino acids from positions 19-407 of a fully defined sequence (SI) of 426 amino acids as given in the specification, sequence having amino acids from positions 18-407 of (SI) that comprises N-terminal methionine or sequence having amino acids from positions 1-407 of (SI). (I) is useful for treating amino acids related to cellular activation, hemostasis, angiogenesis, tumor metastasis, callular migration, ovulation or neurogenesis. (I) is useful for treating immune-related disorders e.g., Crohn's disease, tumor, inflammatory bowel disease, autoimmune diseases, lymphocytic leukemias, or graft versus host disease. (II) is useful for chromosomal cidentification. (I) exhibits enhanced activity, solubility and stability, and is produced in large quantities. This sequence corresponds to a PCR primer to amplify the extracellular domain from the human ILITRLP CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel method for immobilizing a functional organic molecule in a predetermined density on a mixed monolayer surface (MMS). The novel method comprises a first monolayer moiety (MMI) having a covalent bond forming reactive group and a second monolayer moiety (MMZ) covalent bond forming reactive group and a second monolayer moiety (MMZ) thaving an inert group. The method involves contacting MMS with the functional organic molecule to form a covalent bond between the contactional organic molecule and MMI to immobilize the functional organic molecule in a predetermined density on a mixed concluder, the novel method of the invention is useful for immobilizing a functional organic molecule in a predetermined density on a mixed conjugopetides, peptides, polypeptides, oligonucleocides, nucleocides, oligonucleosides, carbohydrates, proteins, nucleosides, uncleotides, oligonucleosides, and small molecules, but preferably a carbohydrate. The carbohydrate comprises a reducing an n-pentenyl group. This polymcleotide converses a primer used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                    Immobilizing functional organic molecule in a predetermined density on a mixed monolayer surface, by contacting the surface with the organic molecule to form a covalent bond and to immobilize the organic molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Also disclosed is a substrate comprising a surface and a plurality of molecules on the surface. The molecules are of formula Surf-L-Q-T where T comprises a reactant ligand, and Surf designates where the molecty attaches to the surface. The substrate can be incorporated into a protein chip comprising a substrate bearing the reaction product of a reactant ligand and a fusion polypeptide comprising a capture polypeptide comprising to the reactant ligand. The alkanethiols of the invention are useful for immobilishing polypeptides on gold surfaces, e.g. for altermining enzyme (especially kinase or protease) activity or detecting antibodies. The present sequence represents a PCR primer used in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present invention relates to alkanethiols substituted with a reactant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid sequences encoding novel mammalian nonerythroid Rh type C and glycoproteins which have a characteristic twelve transmembrane domain
                                                                                                                                                                                                                                                                                                 New alkanethiols substituted with a reactant ligand useful for immobilizing polypeptides on gold surfaces, e.g. for determining enzyme activity or detecting antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAI73060 to AAI79867 represent isolated human polymorphic polymucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).

AAM53114 to AAM5329 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or beletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary
            This invention relates to the nucleic acid and protein sequences of novel human and mouse non-erythroid Rh type C glycoprotein (RhCG). The RhCG protein and the mouse homologue (rhcg) have a characteristic 12 transmembrane domain structure and are expressed in kidneys and testis. The invention also comprises a method for antibody that specifically binds an epitope of the glycoprotein and a method for detecting the protein using this antibody. The antibodies of the invention may be used in Western blots, enzyme linked immunosorbent assays (BLISA) or immunohistochemical assays to identify the non-erythroid tissues, particularly kidney and testis, that express the RhCG or Rhcg glycoproteins. The methods are used for detecting an Rhcg or and Rhcg glycoprotein in a sample. The present sequence represents the intronic sequence at an intron/exon splice site of the rhcg gene of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes adaptor molecules, where each end of the adaptor is compatible with a nucleic acid digested with a restriction enzyme or a nucleic acid compatible with a nucleic acid digested with a retarriction enzyme. The adaptor molecules, compositions, kits and arrays are useful for cloning nucleic acid molecules that does not require the design and synthesis of oligonacleotides or PCR primers. The adaptors, kits and arrays are also useful for ligating two ends of a single nucleic acid molecule. Or ligating two or more nucleic acid molecules. The kits can also be used for performing internal deletion mutagenesis analysis. The adaptor molecules are ligated to a cloning vehicle, making the cloning procedure more rapid and efficient, and less error-prome. This sequence represents a nucleic acid cloning associated
sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar mucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New adaptor molecules, useful for cloning nucleic acid molecules does not require the design and synthesis of oligonucleotides or

The present sequence is that of a primer used, with the primer given in ACF79912, for the PCR amplification of cDNA encoding the human Her-2 protein Cytoplasmic kinase domain. The PCR product was used in the construction of a fusion protein comprising the Her-2 kinase domain and a modified (W687F mutant) chitin binding domain (CBD) of Bacillus circulans PL-12 chitchase Al. The modified CBD acted as an affinity tag for purification of the Her-2 kinase domain, allowing protein elution under non-denaturing conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                 (mutant) chitin binding domain capable of reversibly binding a chitin bstrate under a selected non-denaturing condition, useful for producing d purifying a target protein molecule.
                                                                            Human; Her-2; chitin binding domain; affinity tag; protein purification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lymphocyte activator protein 33; body fluid immunity disorder; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 39;
                                         Human Her-2 protein cytoplasmic kinase domain PCR primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes adaptor molecules, where each end of the adaptor is compatible with a nucleic acid digested with a restriction enzyme or a nucleic acid comprising an end that is compatible with a nucleic acid digested with a restriction enzyme. The adaptor molecules, compositions, kits and arrays are useful for cloning nucleic acid molecules compositions, rot require the design and synthesis of oligonucleotides or PCR primers. The adaptors, kits and arrays are also useful for ligating two ends of a single nucleic acid molecule. The kits can also be used for performing internal deletion mutagenesis analysis. The adaptor molecules are ligated to a cloning vehicle, making the cloning procedure more rapid and efficient, and less error-prone. This sequence represents a nucleic acid cloning associated

                                                                                                                The invention relates to a lymphocyte activator protein 33, the encoding polymuclectide, and a method for preparing the polypeptide by DNA recombination technique. The polypeptide is used in treating diseases such as body fluid immunity disorder and tumours. The current sequence represents a lymphocyte activator protein 33 related probe sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections.
                                                         protein 33 and encoding polynucleotide, useful for

protein coupled receptors manually of positive in the present sequence is one such oligonucleotide. The oligonucleotides and the present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune systemic lupus erythromatosus and Grave's diseases, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the expression of heteromeric receptor proteins, e.g. from an immunoglobulin (Ig) superfamily, in cells containing the heteromeric receptor genes on a single plasmid. Especially mentioned, the cell may be a bacteriophage, where the receptor protein are expressed as fusion proteins with the surface protein gVIII. Primers AAX16911-X16936 were used in the construction of plasmid M13IX30 (AAX16937) for expression of receptor heavy chain proteins. Light chain genes are cloned into the plasmid M13IX11 (AAX16953). The methods can be used to generate diverse populations of heteromeric receptors which mimic the natural immune system and can be used for diagnostic and therapeutic purposes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Heteromeric; receptor; immunoglobulin; superfamily; plasmid; primer; PCR; bacteriophage; fusion protein; amplification; heavy chain; light chain; immune system; diagnosis; ss.

The kit simply and efficiently generates a large repertoire of diverse combinations of heteromeric receptors. Only proper combinations of vector portions are randomly brought together for the coexpression of different DNA sequences without loss of population size or diversity. AAZ91524 to AAZ91528 represent bacteriophage M13 vector nucleotide sequences constructed in the exemplification of the present invention. AAZ91529 to AAZ91529 represent oligonucleotides used in the construction of vectors in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a kit (I) for the preparation of vectors for the coexpression of two or more DNA sequences encoding polypeptides comprising two vectors which operatively combine through two pairs of restriction sites to form a single vector. The kit is useful for the preparation of vectors for the coexpression of two or more DNA sequences
                                                                                                                                                                                                                                                                                                                                                                         Bacteriophage M13 vector; prokaryotic cell; heteromeric receptor; antibody; immune system; filamentous bacteriophage; cloning; screening; coexpression; PCR primer; mutagenesis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Kit for the preparation of vectors for the coexpression of two or more DNA sequences encoding proteins that form heteromeric receptors.

The invention describes adaptor molecules, where each end of the adaptor is compatible with a nucleic acid digested with a restriction enzyme or a nucleic acid comprising an end that is compatible with a nucleic acid digested with a restriction enzyme. The adaptor molecules, compositions, kits and arrays are useful for cloning nucleic acid molecules, compositions, hot require the design and synthesis of oligonucleotides or PCR primers. The adaptors, kits and arrays are also useful for ligating two ends of a single nucleic acid molecule, or ligating two or more nucleic acid molecules. The kits can also be used for performing internal deletion mutagenesis analysis. The adaptor molecules are ligated to a cloning vehicle, making the cloning procedure more rapid and efficient, and less error-prone. This sequence represents a nucleic acid cloning associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transcription PCR. By contacting the amplification products of the PC at least one of the genotype specific hybridisation probes described AAQ83902-Q83928, the genotype of the amplified HCV can be determined. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAQ83896-Q83901 are primers for hepatitis C virus (HCV) reverse

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a viral vector constructed by the fusion of a viral protein with a ligand which binding specifically to the melanocytestimulating hormone (MSH) receptor. The vector contains one of four linkers represented by sequences AAA3815-A93818 and AAB2383-B23586, and DNA encoding a fibre protein selected from those represented by AAA93819-93826 and AAB23867-B23594. The vector has cytostatic activity, and can be used for gene therapy and in the diagnosis and treatment of tumours, particularly malignant melanomas. The present sequence represents a PCR
Viral vector; melanocyte-stimulating hormone receptor; MSH; cytostatic; tumour; malignant melanoma; fibre protein; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis C virus; HCV; non-A non-B; reverse transcription; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                             Virus vector useful in diagnosis and treatment of tumors particularly malignant melanoma, constructed by fusing viral protein with ligand binding specifically to melanocyte-stimulating hormone receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection.
                                                                                                                                                                                                                                                                                                                                                                          AAT16689-T16694 are a set of RT-PCR primers used for the identification of the CDRA sequence of the B1 (envelope-1) gene of 51 HCV isolates. The isolated sequences are useful for the proof. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the CDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis C virus; HCV; inducible promoter; HCV infection; PCR; primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAT16689-T16694 are a set of RT-PCR primers used for the identification of the CDNA sequence of the B1 (envelope-1) gene of 51 HCV isolates. The isolated sequences are useful for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection.
